

# Overthrowing the Divine Creator

Since the very beginning, human beings witnessed the mystique nature, and their astonishment made them wonder and question the existence of a divine creator. The earth seemed as if a wise architect had designed it keeping in mind the need of every organism on earth. There were things that could not be explained, and as time passed, people begin to seek answers for these bewildering and perplexing things. Science gave new perspectives and ideas to the world, but most still chose to believe in that supreme being. People had faith and it let them survive the most difficult times, it gave them hope. Religions are ultimately based on the gods they worship and each of it has its own legacy, even history has contributed a great deal. People beheld inexplicable happenings and named them miracles. Mankind had faith then and shall have now and always.

Homo sapiens certainly have been predominating the Earth since long, but it doesn't change the fact that human beings and the other organisms are interdependent upon each other and neither of them owns the earth. Our dynamic mutual relationship with other life forms is transforming drastically into dictatorship, over the past decades we have been replacing nature's endeavours with spurious and artificial work of automatons. This development happening in the world every second is both propitious and devastating at the same time. Moreover, we have been inventing things to make our lives easier but now at some point we need to stop, human beings are suppressing their physical abilities and vigour which certainly affects their own life expectancy.

There was a time when untainted air dominated the atmosphere and when people were grateful to the enrapturing nature, for they had seen much of it. Towns were like a family, kindred and civil. People led a heuristic lifestyle, they actually beheld and directly experienced what we see today through technology. Things like trains and motorcycles had a great significance and were a part of the utmost luxuries, which are now considered substandard. Development and technology have come a long way from these days. Modern perception is that those days are much older and that the people were distressed without the facilities we relish nowadays. Well, these seemingly bygone days are just decades ago and people actually cherished that time. Simply enough, these days are considered old because the world developed at a faster pace.

Some people have always felt a need for the world to be changed, civilised and modernised. Industrialisation, development in science and technology and many more such factors have indeed transformed the world. We studied our pasts through literature and history, and even entertainment factors like music and dance. Science has given answers to many unresolved mysteries and myths. As in technology, the invention of the internet has made a substantial change and has an immense role in our lives. A variety of transports have given mankind a huge relief, introduction of artificial intelligence has provided with opportunities but has its own drawbacks . Fields like artificial technology itself, has accelerated and now have reached a level which is convenient and needs no further improvements or advances.

There has been much controversy about the complications that the excess modification and establishment of these things could bring in the balance in nature. The thing we need to ponder upon is, why do we feel the need to enhance technologies that are rather satisfying and trouble-free as the way they are, even though we are aware of the devastation it might cause. Many life forms have become extinct owing to some selfish human behaviour and now with the advent of some fatal diseases, mankind is getting a taste of its own medicine. Uncontrolled Construction, excess mining, haphazard setting up of mobile and internet towers, population explosion, burning fossil fuels, decline of natural resources, global warming, the advent of powerful new technology, war etc is indeed the beginning of brutal and drastic transition of the world.

However now as the world is being dominated by our artificial inventions more than Nature and innate originalities, we shall contemplate if the next generations will be able to encounter the inexplicable and experience innate divinity whilst cherishing the reality of nature, and wonder who made these reasons of profound happiness. But with the advent of such new and disastrous technologies that are unnaturalizing our lives, chances are perhaps, the next generations might believe that the source and creator of everything today is the human itself, for all that would be left for them to see would be the artificial creations of human.
